DNR discussions with seriously ill patients should always take place in the context of the larger goals of care, using a step-wise approach. Prior to any DNR discussions, physicians must know the data defining outcomes and morbidity of CPR in different patient populations.

1. Establish the setting
Ensure comfort and privacy; sit down next to the patient. Ask if family members or others should be present. Introduce the subject with a phrase such as: I’d like to talk with you about possible health care decisions in the future.

2. What does the patient understand?
An informed decision about DNR status is only possible if the patient has a clear understanding of their illness and prognosis. Ask an open-ended question to elicit patient understanding about their current health situation. It is important to get the patient talking—if the doctor is doing all the talking, it is unlikely that the rest of the conversation will go well. Consider starting with phrases such as: What do you understand about your current health situation? or What have the doctors told you about your condition? If the patient does not know/appreciate their current status this is time to review that information.

3. What does the patient expect?
Ask the patient to consider the future. Examples of ways to start this discussion are: What do you expect in the future? or What goals do you have for the time you have left—what is important to you? This step allows you to listen while the patient describes a real or imagined future. Most patients with advanced disease use this opening to voice their thoughts about dying—typically mentioning comfort, family, and home, as their goals of care. If there is a sharp discontinuity between what you expect and what the patient expects, this is the time to clarify. Listen carefully to the patient’s responses; most patients have thought a lot about dying, they only need permission to talk about what they have been thinking. Setting up the conversation in this way permits the physician to respond with clarifying and confirming comments such as: So what you’re saying is, you want to be as comfortable as possible when the time comes. or What you’ve said is, you want us to do everything we can to fight, but when the time comes, you want to die peacefully. Whenever possible, ask patients to explain the values that underlie their decisions: can you explain why you feel that way?

4. Discuss a DNR order
Use language that the patient will understand, give information in small pieces. Don’t introduce CPR in mechanistic terms (e.g., “starting the heart” or “putting on a breathing machine”). Never say, “Do you want us to do everything?” “Everything” is euphemistic and easily misinterpreted. Using the word “die” helps to clarify that CPR is a treatment that tries to reverse death. To a layman, when the heart and/or lungs stop, the patient dies.

If the patient and doctor mutually recognize that death is approaching and the goals of care are comfort, then CPR is not an appropriate medical intervention and a clear recommendation against CPR should be made. You can say: We have agreed that the goals of care are to keep you comfortable and get you home. With this in mind, I do not recommend the use of artificial or heroic means to keep you alive. If you agree with this, I will write an order in the chart that if you die, no attempt to resuscitate you will be made.

If the clinical situation is more ambiguous in terms of prognosis and goals of care, and you have no clear recommendation, the issue of DNR can be raised by asking: If you should die in spite of all of our efforts, do you want us to use heroic measures to attempt to bring you back? or How do you want things to be when you die? If you are asked to explain “heroic measures”, then
describe the purpose, risks and benefits of CPR in greater detail. The clinical pearl here is to start
general and become specific later in the conversation.

5. Respond to emotions
Strong emotions are common when discussing death. Typically the emotional response is brief.
The most profound initial response a physician can make may be silence, providing a reassuring
touch, and offering facial tissues. (see Fast Fact #29)

6. Establish a plan
Clarify the orders and plans that will accomplish the overall goals you have discussed, not just the
DNR order. A DNR order does not address any aspect of care other than preventing the use of
CPR. It is unwise and poor practice to use DNR status as a proxy for other life-sustaining
therapies. Consider using words: We will continue maximal medical therapy to meet your goals.
However, if you die, we won’t use CPR to bring you back. Or It sounds like we should move to a
plan that maximizes your comfort. Therefore, in addition to a DNR order, I’d like to ask my
hospice/palliative care colleagues to give you some information.
